Pavemetrics

Application: ROADS distress and DTM

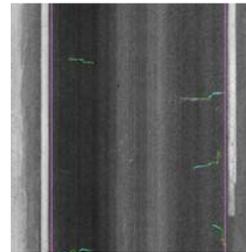

Any Paved Surface

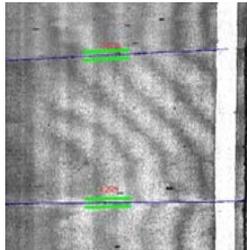

Hotmix

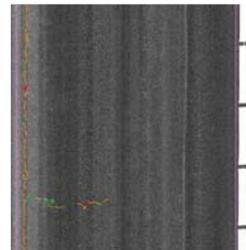

Chipseal

Concrete

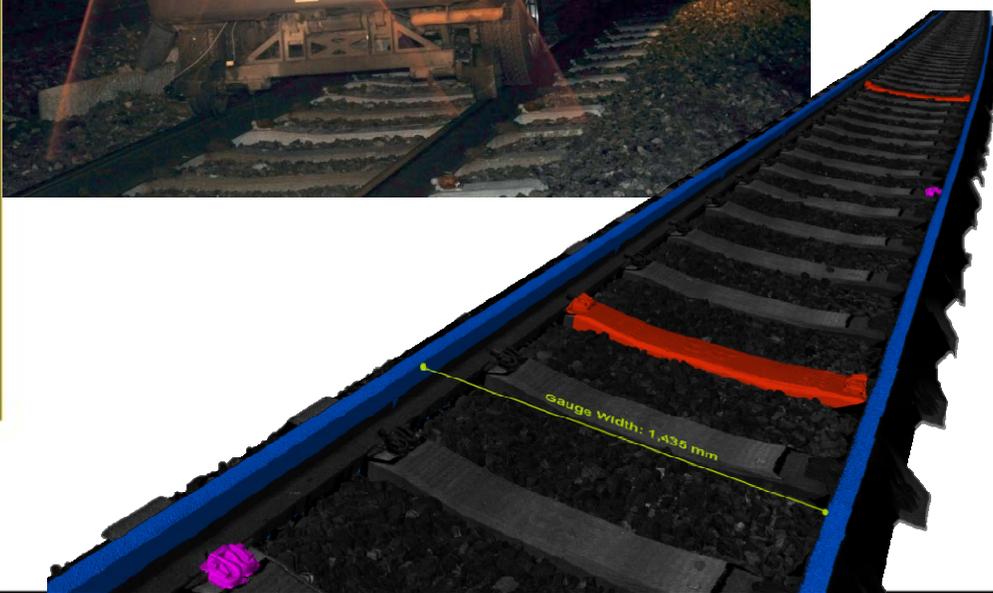

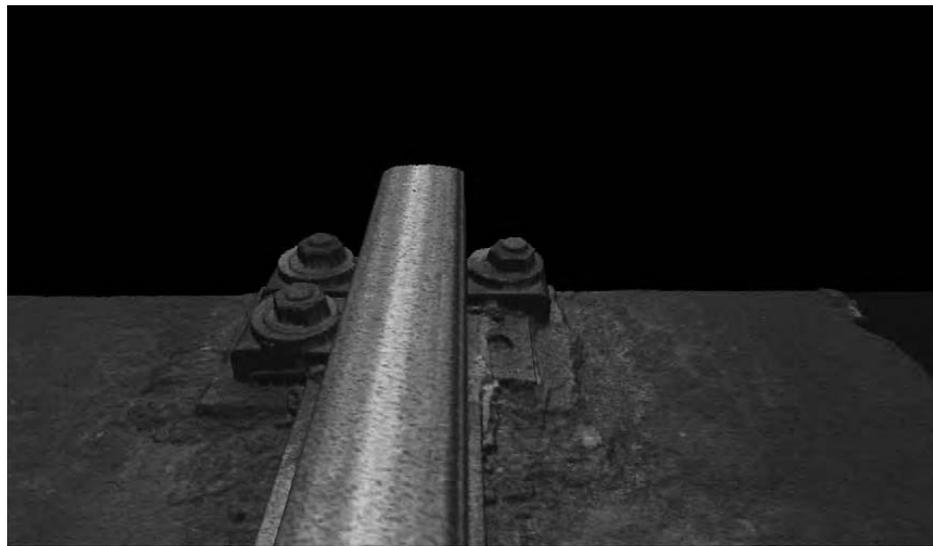

Porous

Pavemetrics

The Sensor Technology Most Relied-on by DOTs worldwide

APPLICATION: Tunnels

Pavemetrics

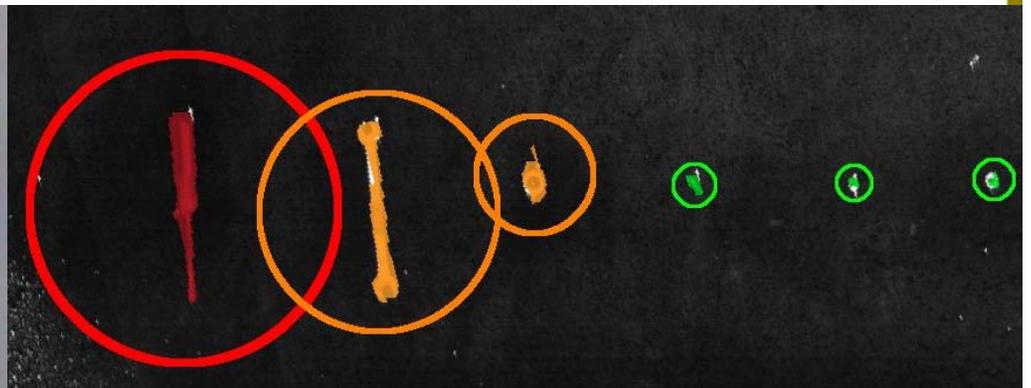

Application: Airports - FOD

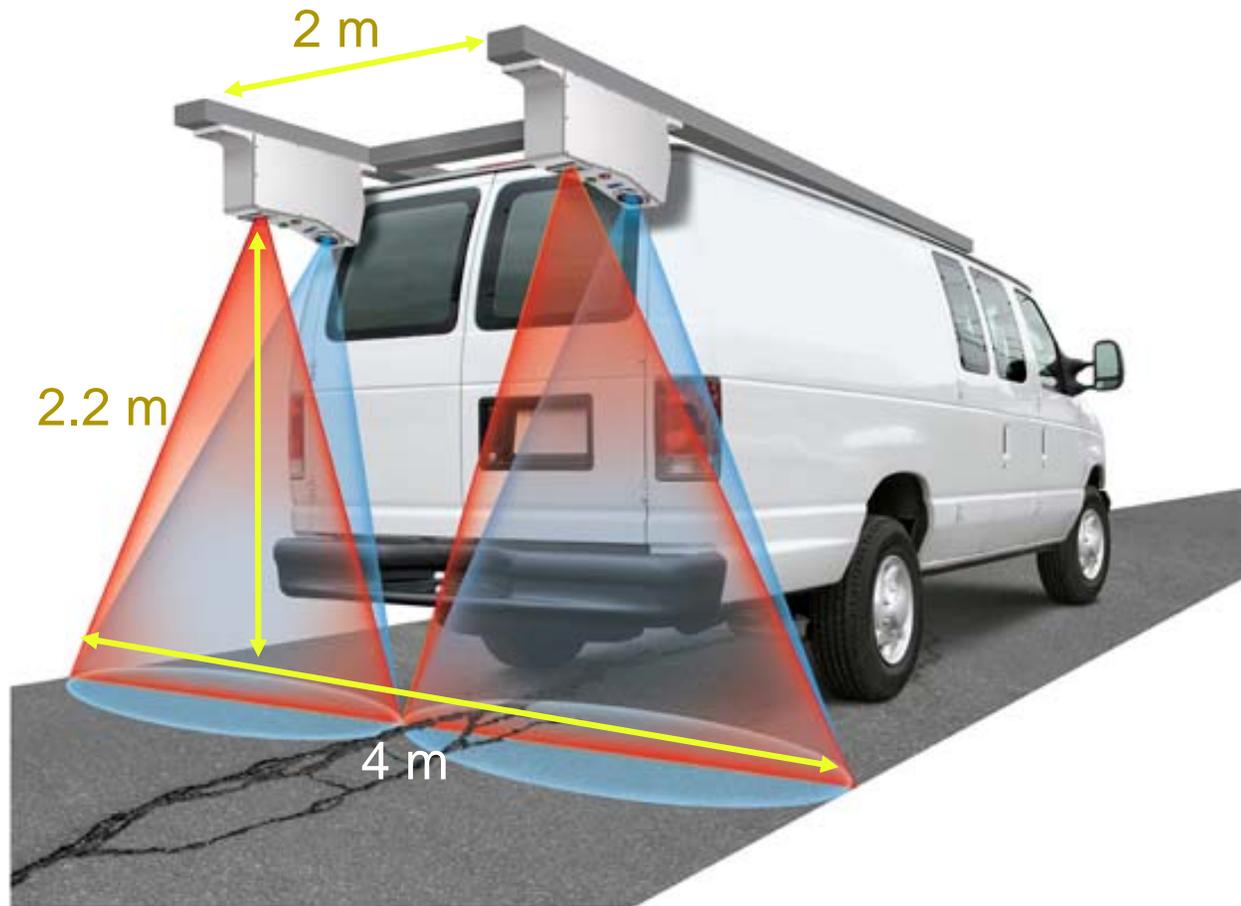

Google Earth interface showing a map of an airport area. The map displays numerous data points representing FOD locations, with numerical values such as 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200. A red triangle icon is visible on the map. A detailed information window is open, displaying the following data:

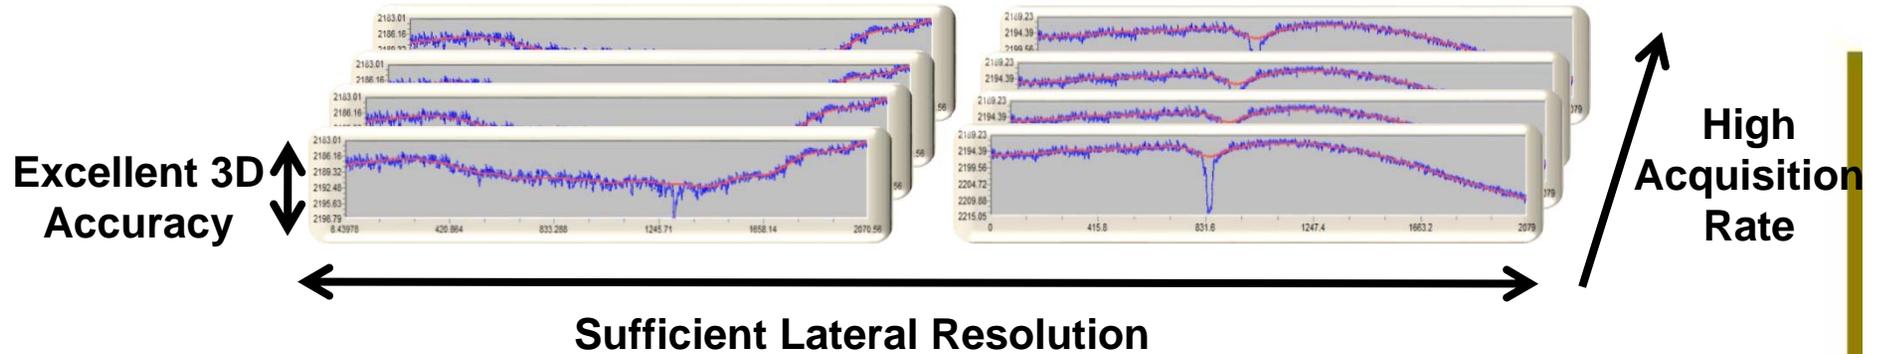

FOD information:	
Area (mm ²)	51.00
Maximum Height (mm)	39.10
Average Height (mm)	12.40
GPS Coordinate	Longitude: -79.603483 Latitude: 43.671040 Altitude: 166.065002
Bounding Box	MinX: 726.50 MaxX: 858.50 MinY: 702.70 MaxY: 787.20

The information window also includes a small image of the FOD object, which is a red triangle. The image is credited to Pavemetrics Systems Inc. © 2012.

LCMS - Specifications

LCMS Specifications

LCMS-1 / LCMS-2

Acquisition Rate

5,600 - 28,000 profiles/s

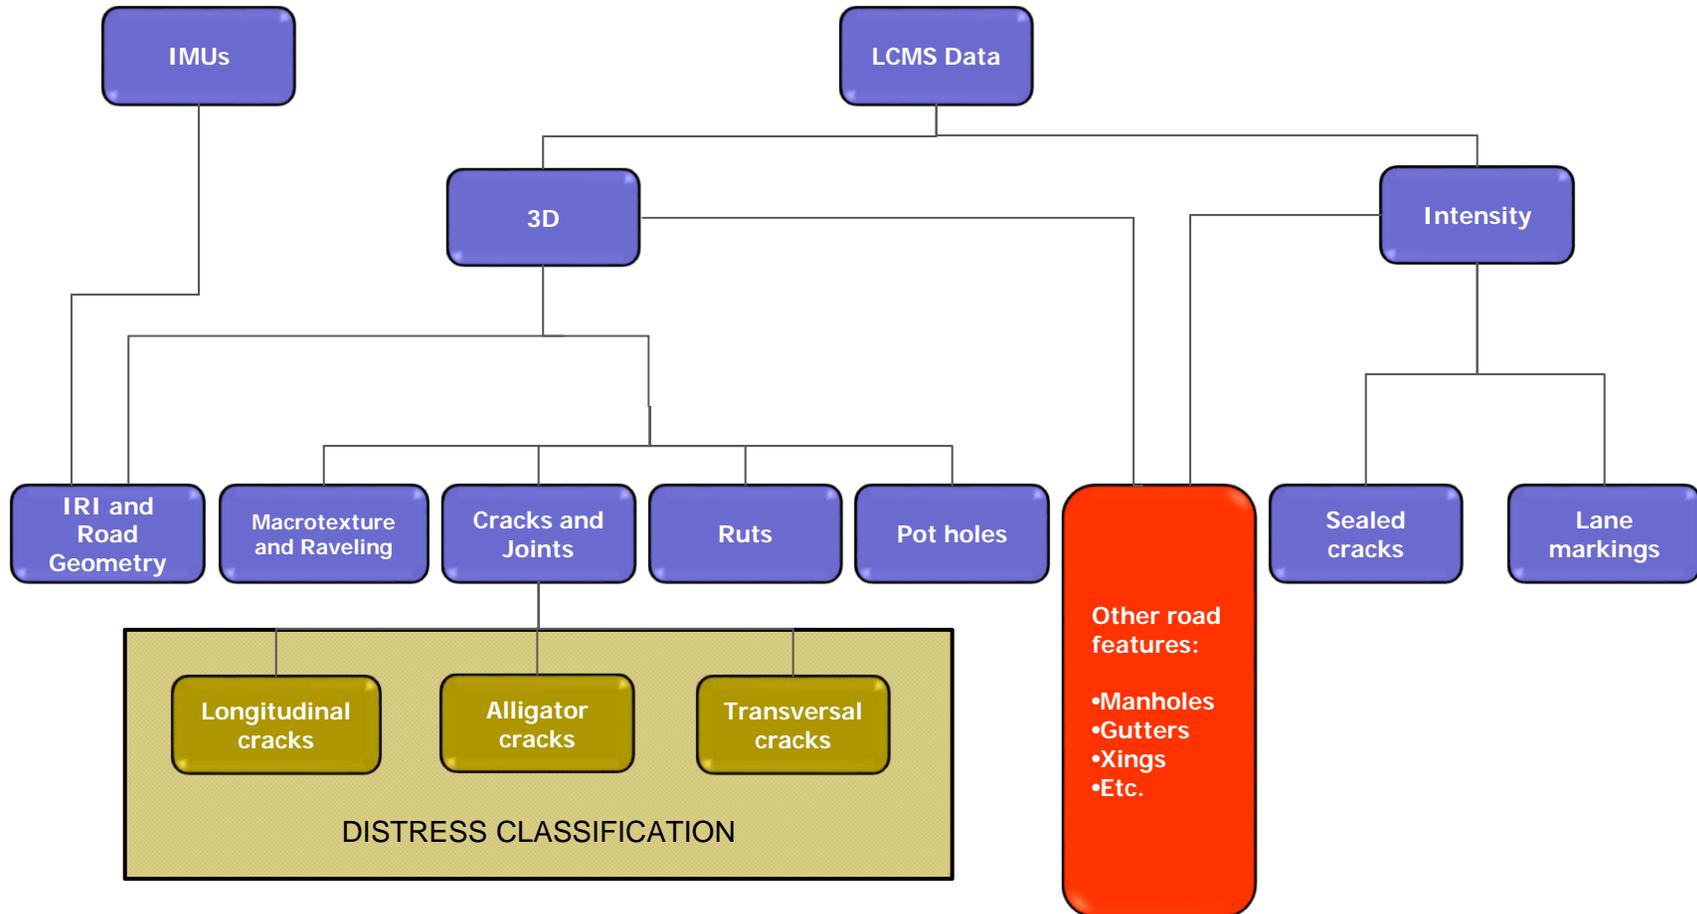

Elevation (z) Resolution

0.25mm / 0.1mm

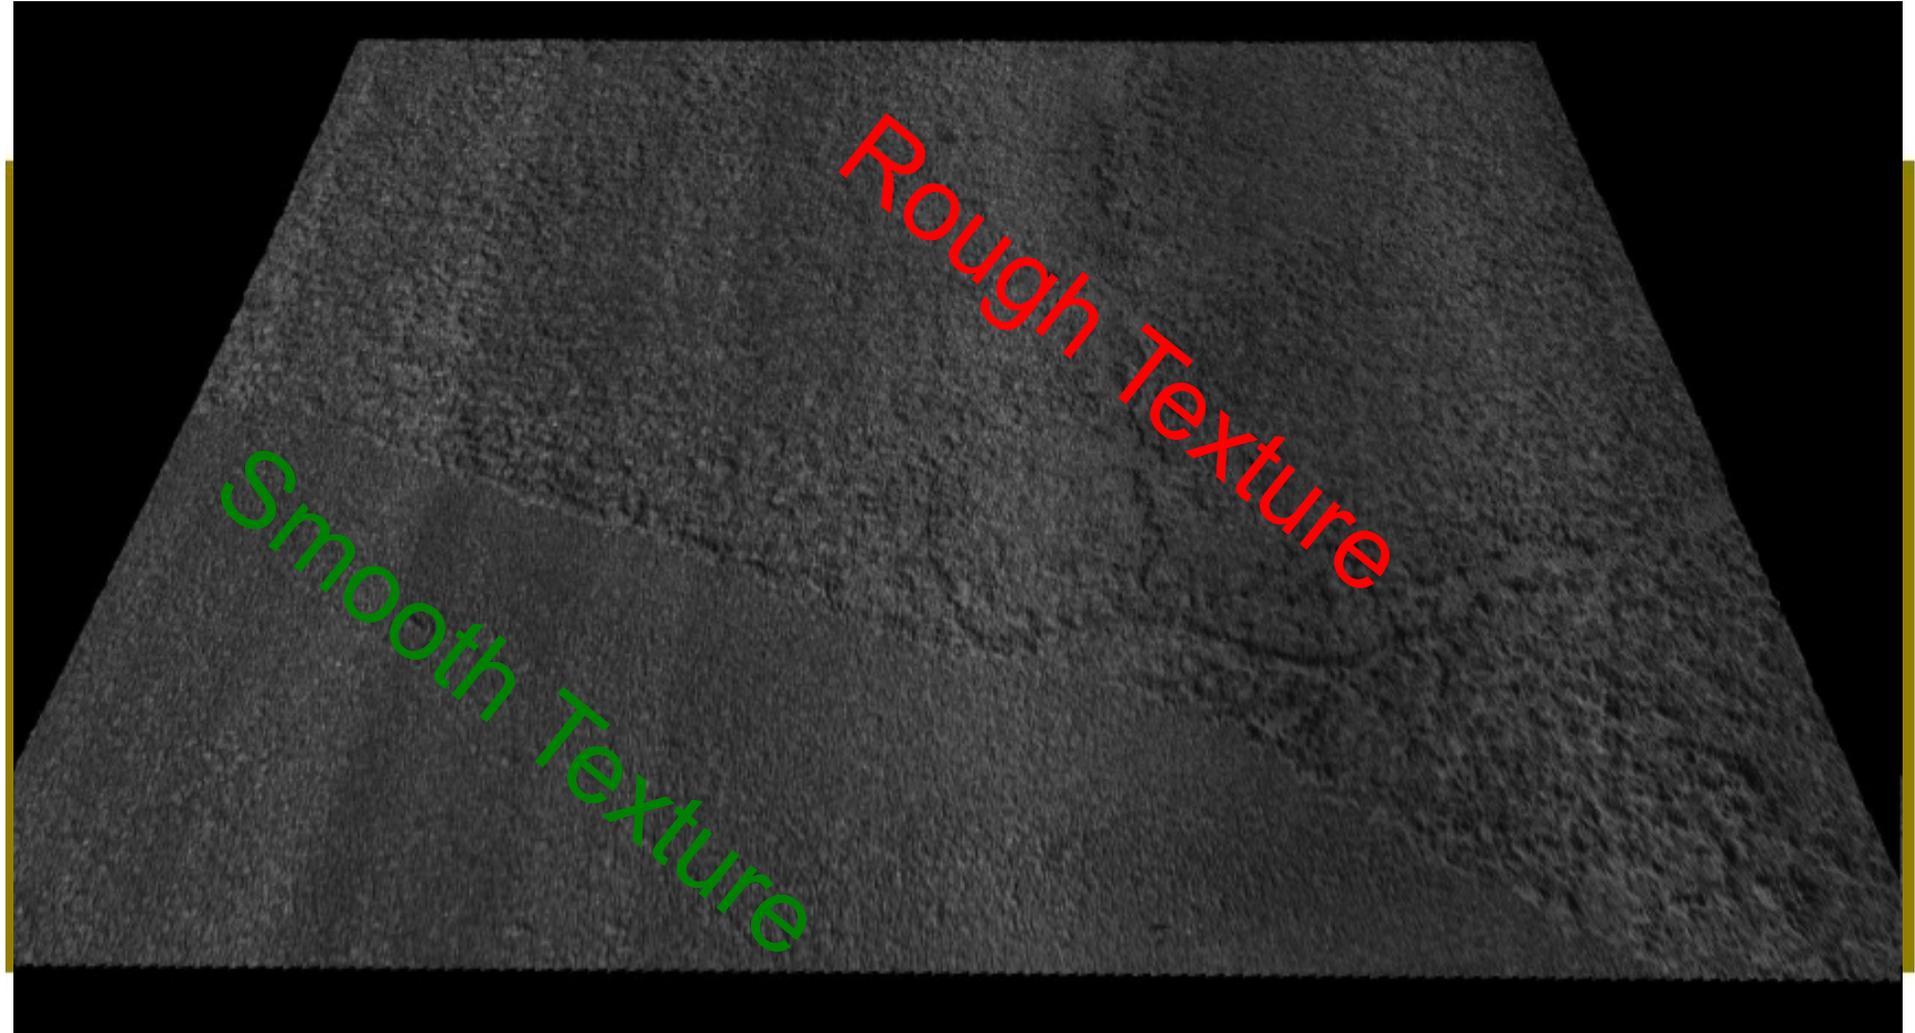

Lateral Resolution

1mm (FOV = 4m)

LCMS Data Processing Tree

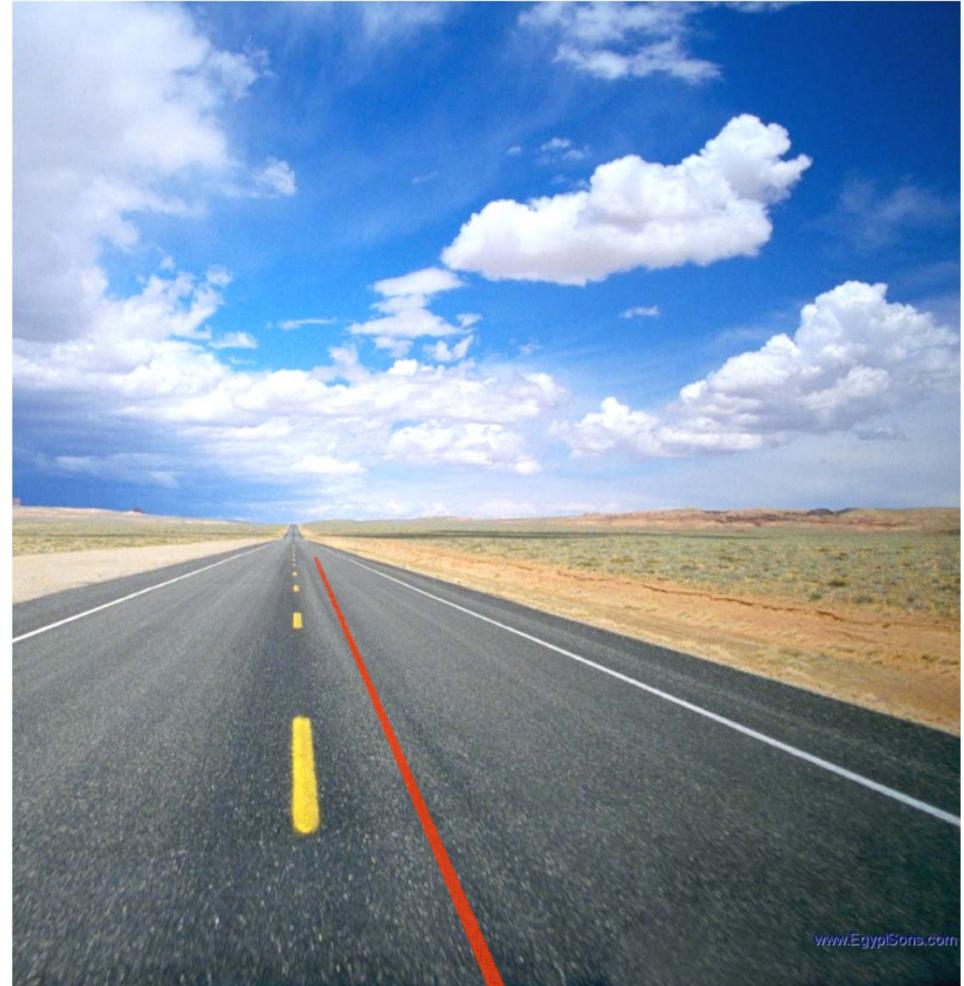

Macrotexture - Example LCMS raw data

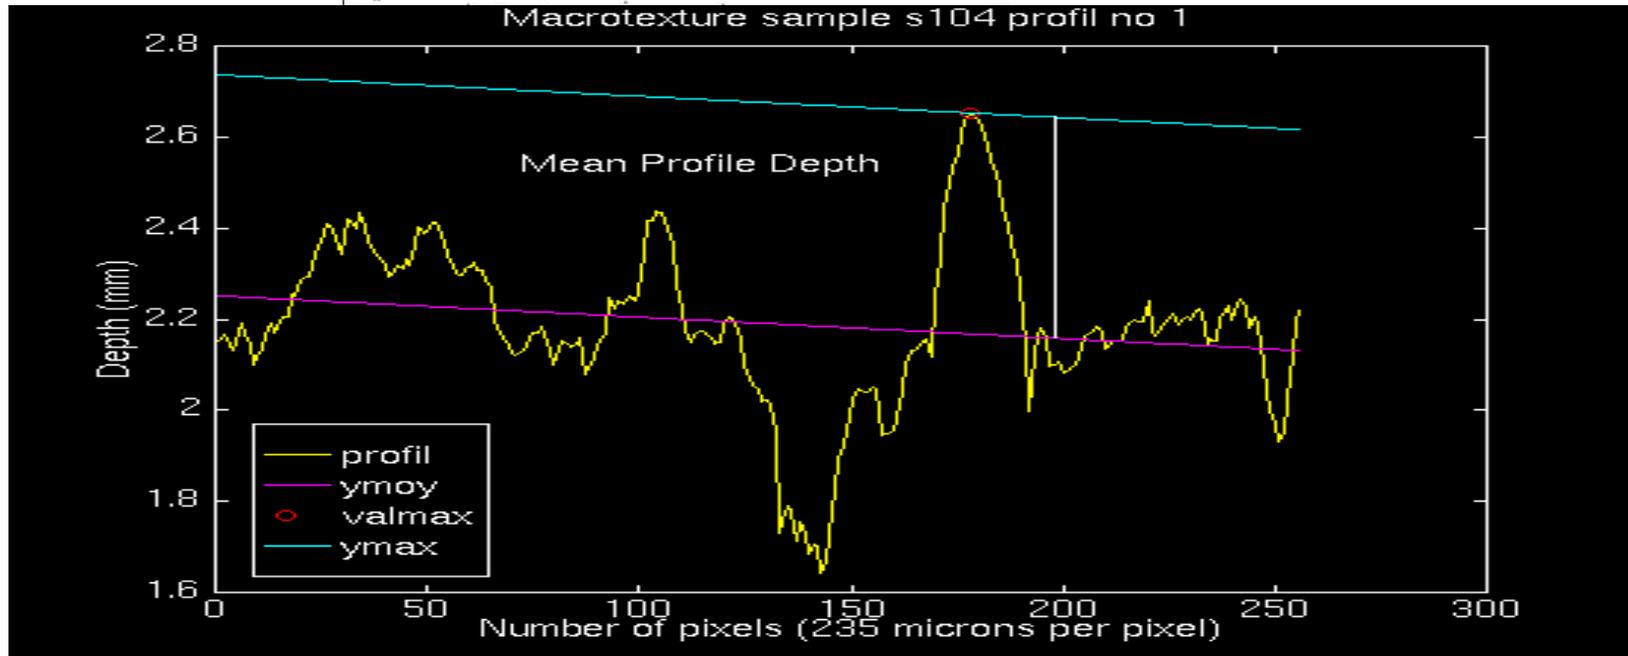

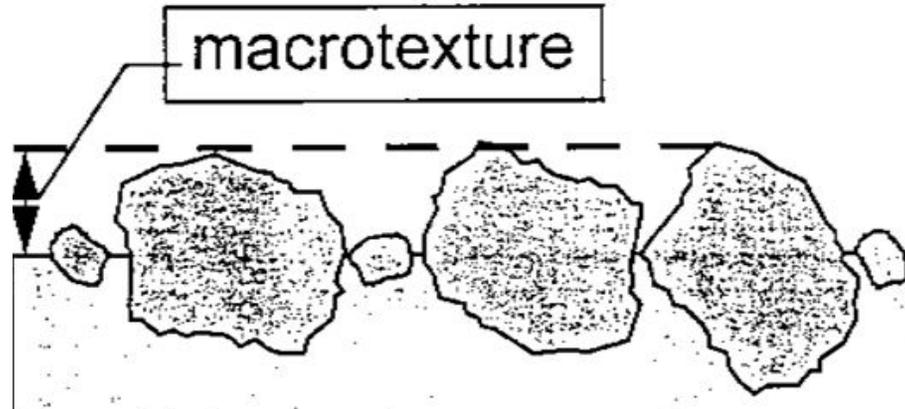

Mean Profile Depth (MPD) (ASTM E1845) – Texture laser

Specifications:

- 32kHz or 64kHz laser
- 1mm point spacing
- 0.05mm vertical resolution
- Low pass filtering 2.5mm features removed. 5mm+ features kept intact.

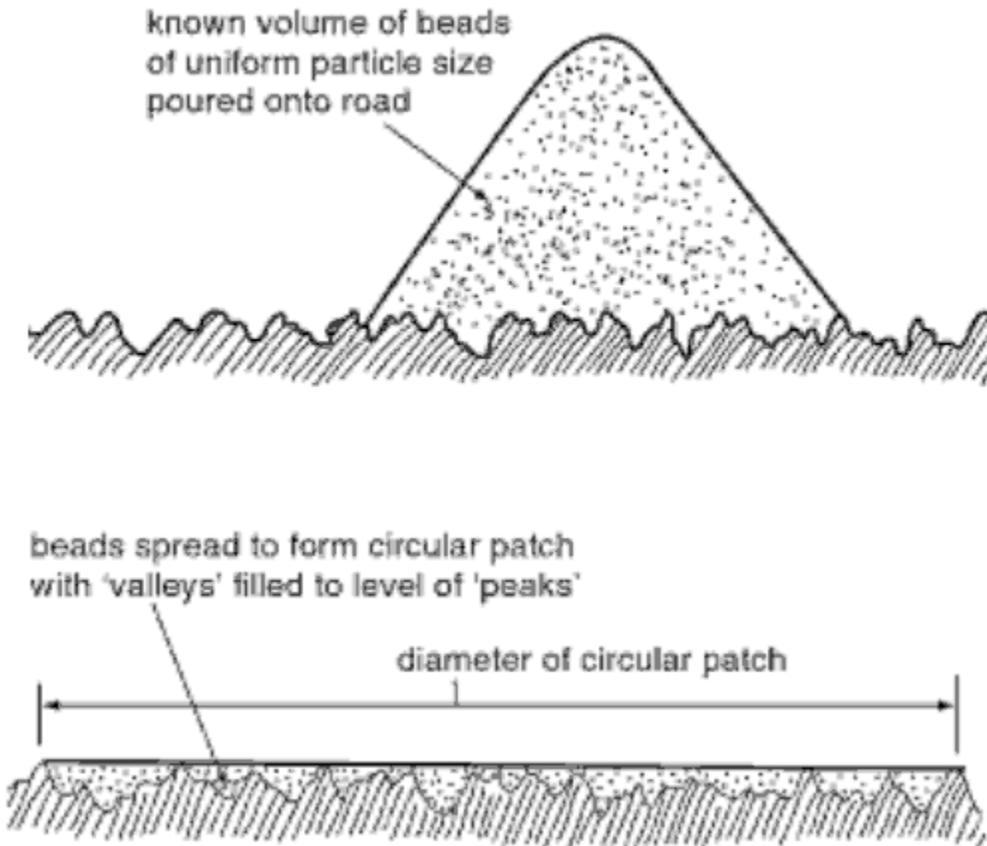

Mean Profile Depth (MPD) (ASTM E1845-01)

Sand patch method (MTD) (ASTM E965)

Sand patch method (MTD) = Volume of sand (fixed) divided by diameter measured (surface area)

It doesn't really matter because:

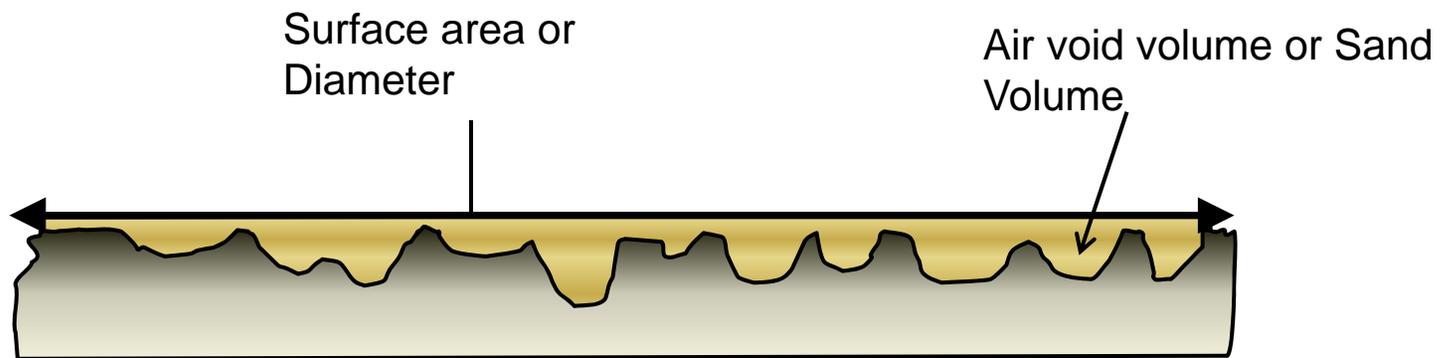

$$MTD = 0.8 * MPD + 0.2$$

- Full lane network level texture survey is possible at 100kmh
- Digital Sand Patch method (MTD)
- Macro-texture is reported:
 - 5 AASHTO bands
 - 25x25cm texture maps

Sand patch method (MTD) (Automated)

Automatic method MTD = Air void volume measured divided by a fixed surface area (approx square foot, 25x25 cm)

$$\text{MTD} = \frac{(\text{Volume}_{\text{air void}})}{\text{Surface Area}}$$

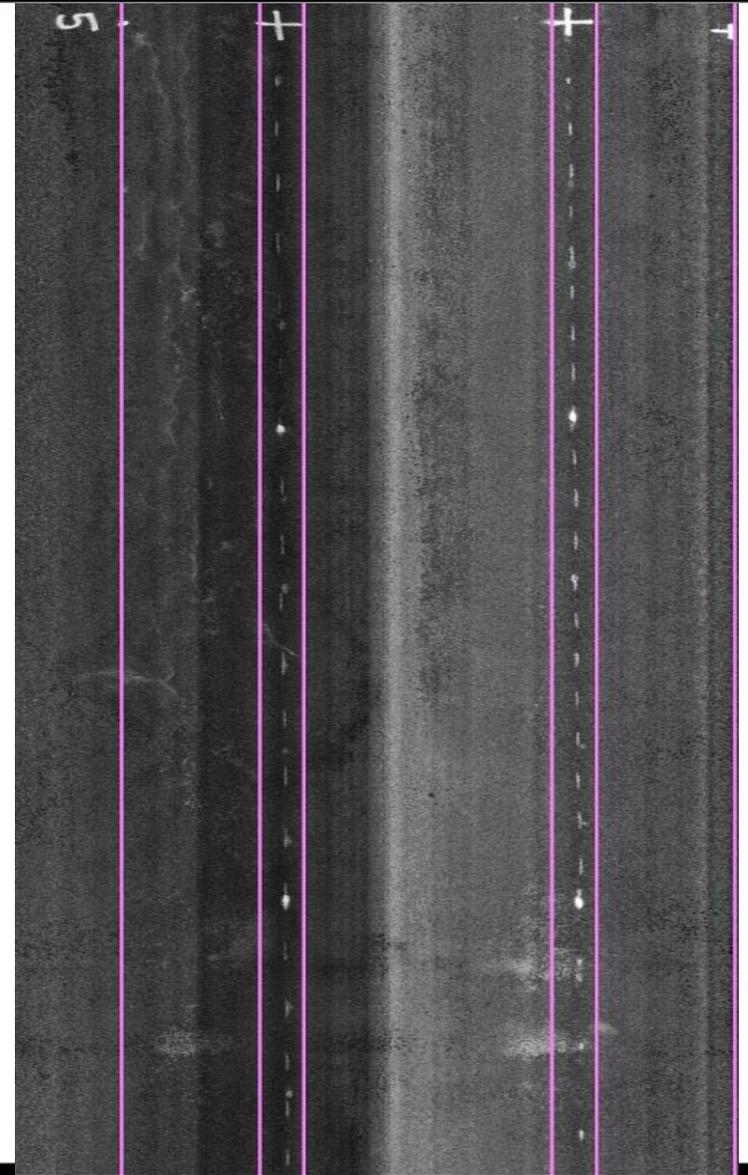

NZTA – Macro-texture validation with SLP

- Reference device is a SLP (Stationary Laser Profiler) used by New Zealand Transit Authority
- The SLP uses a 32kHz Selcom® laser with a spot size of 0.5 mm to take a profile measurement every 0.3 mm.
- The laser traverses along a 1.67m track by a drive from a toothed belt.
- It was laid end to end throughout the texture validation sites to provide the reference texture measurements (MPD).
- To compare with LCMS texture the SLP results were converted using $MTD = 0.8 * MPD + 0.2$

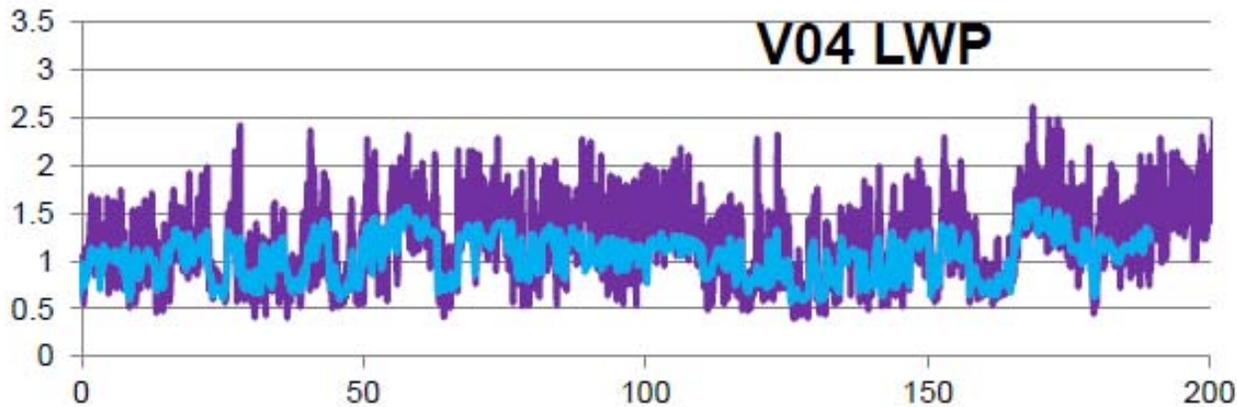

NZTA – Macro-texture validation with SLP

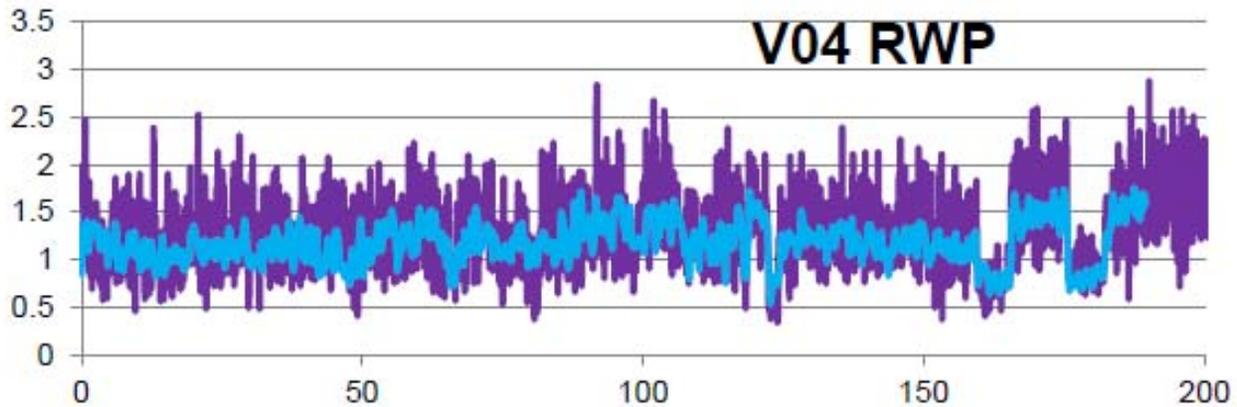

- 7 different survey sites in New Zealand.
- The length of each survey site is 200m (except site V07 which is 300m).
- Texture range from 0.4mm (MPD) to 3.5mm (MPD)
- Multiple runs of LCMS data were collected on each survey site, at different speeds (30km/h, 50km/h and 80km/h).
- The SLP measurement paths are marked with paint. This is the transversal position where the SLP device measures the texture.
- The SLP device outputs one MPD value every 10cm, for each wheel path

SLP vs LCMS(MTD unfiltered)

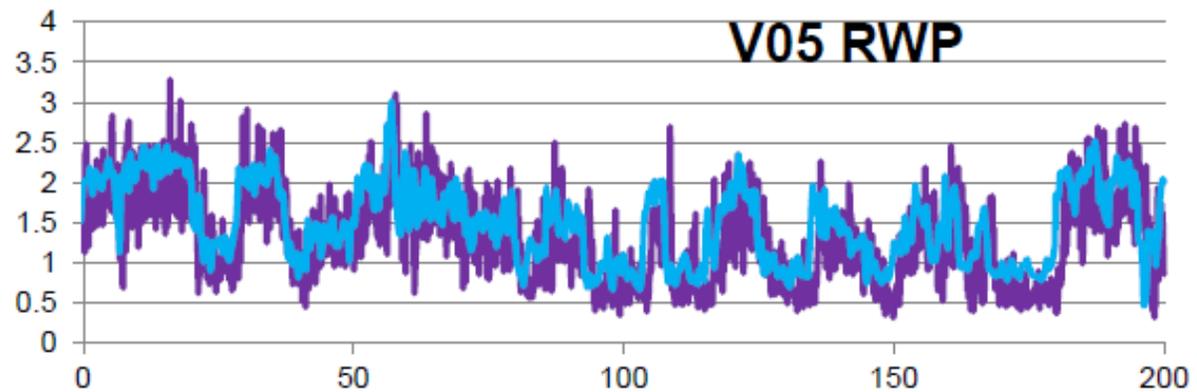

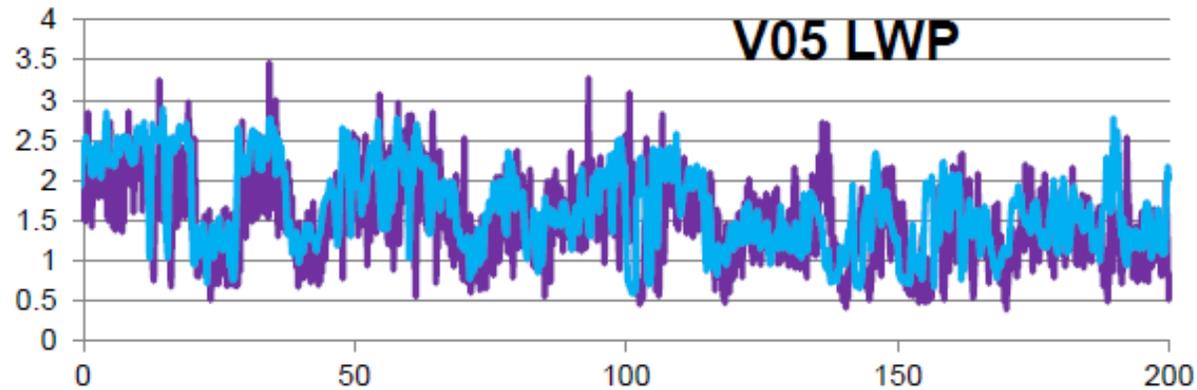

— LWP MTD (SLP)
— LWP V04504 MTD (LCMS)

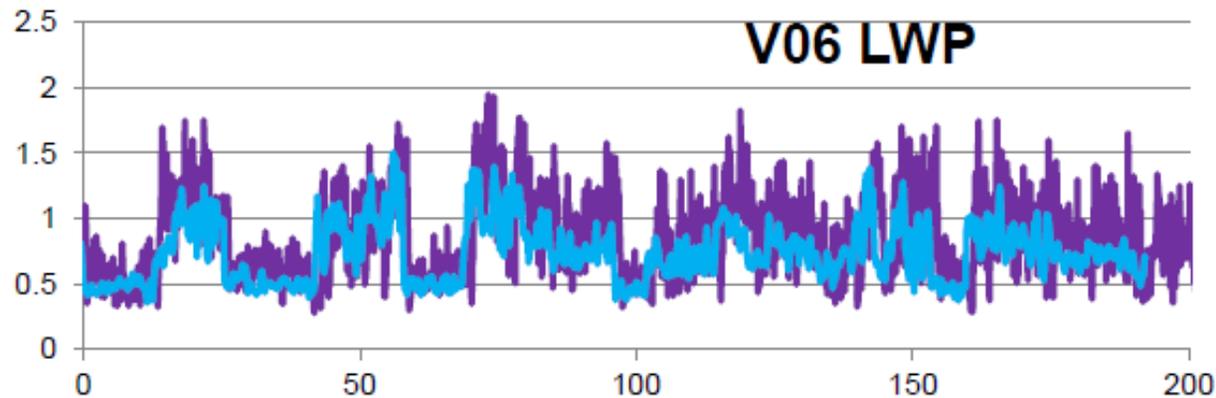

— RWP MTD (SLP)
— RWP V04504 MTD (LCMS)

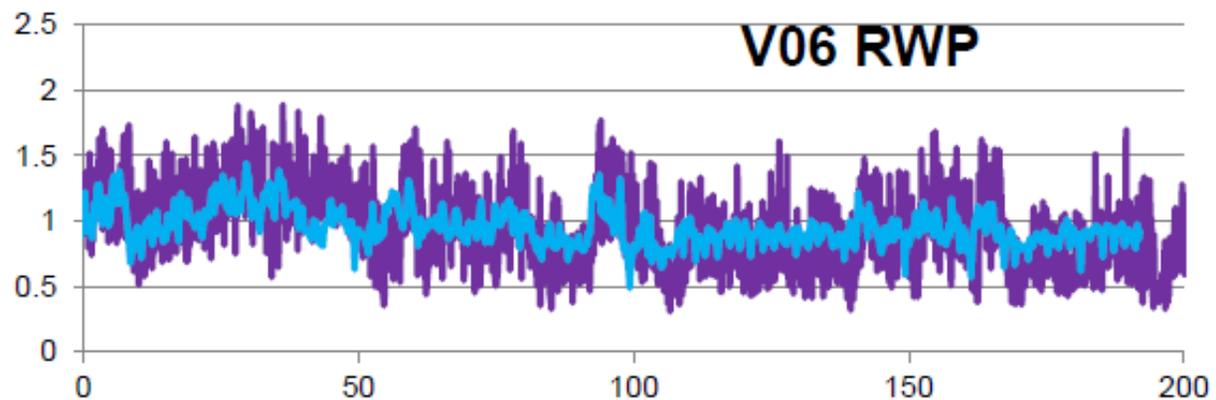

SLP vs LCMS(MTD unfiltered)

SLP vs LCMS(MTD unfiltered)

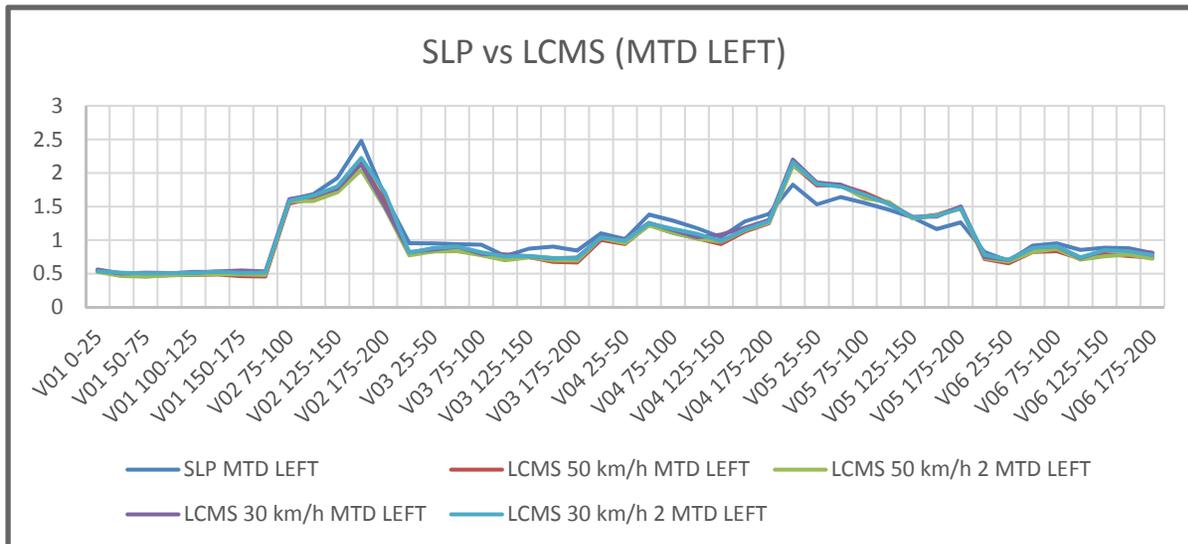

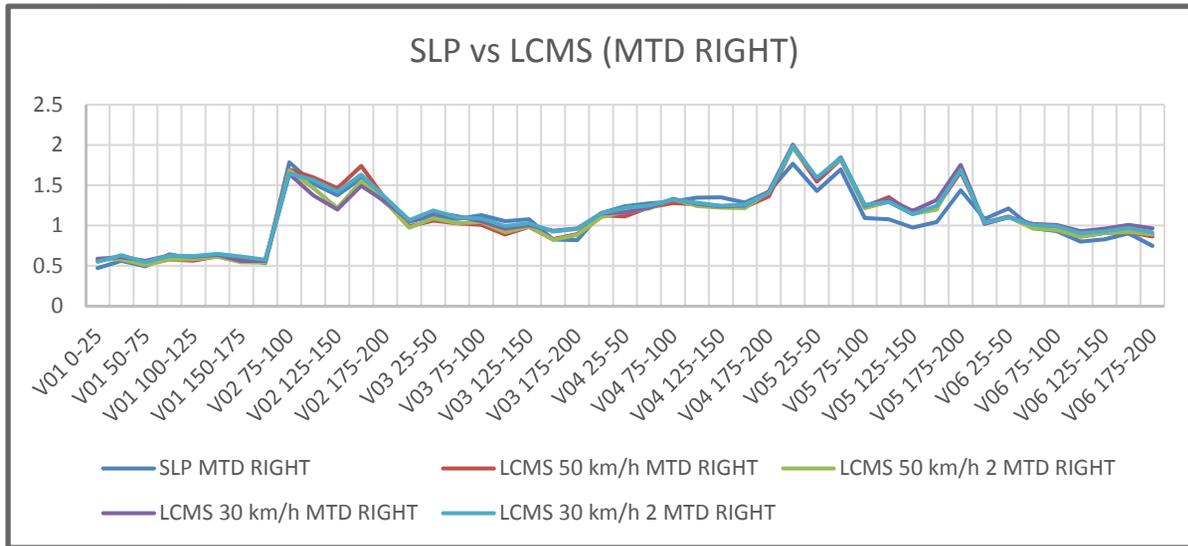

— LWP MTD (SLP)
— LWP V06504 MTD (LCMS)

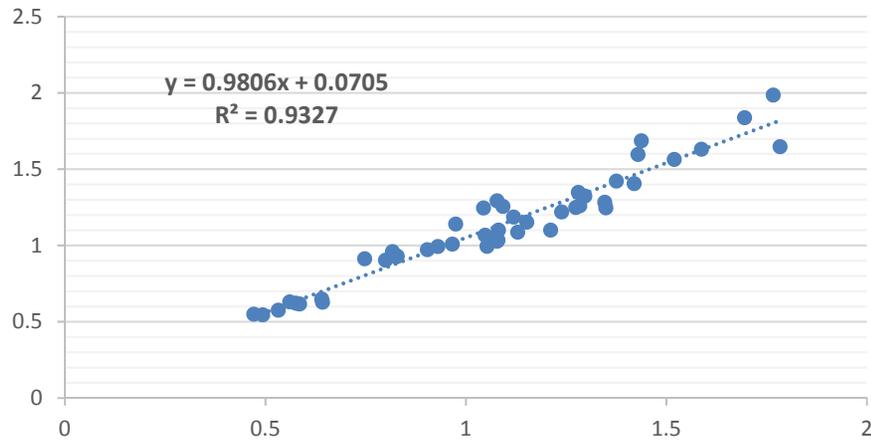

— RWP MTD (SLP)
— RWP V06504 MTD (LCMS)

SLP vs LCMS (MTD average 25m)

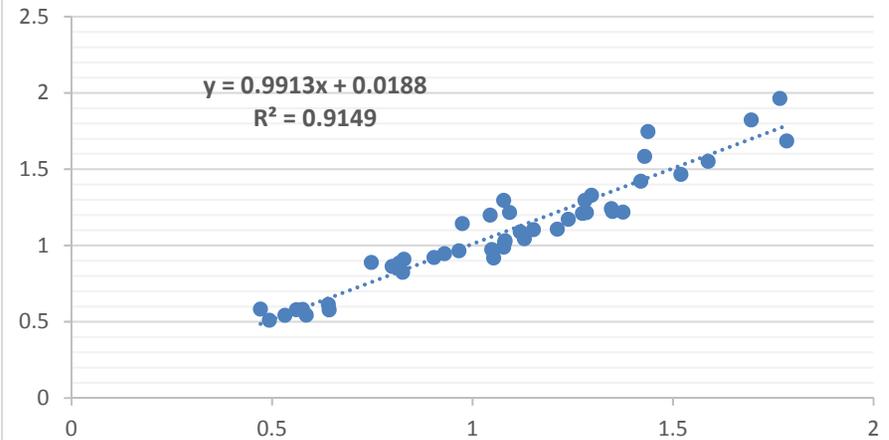

NZTA - Macro-texture validation with SLP

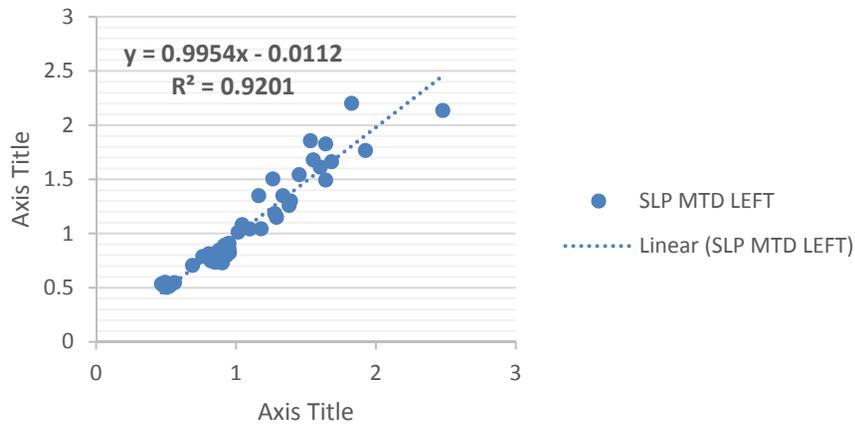

SLP MTD RIGHT vs LCMS MTD RIGHT 30 KM/H

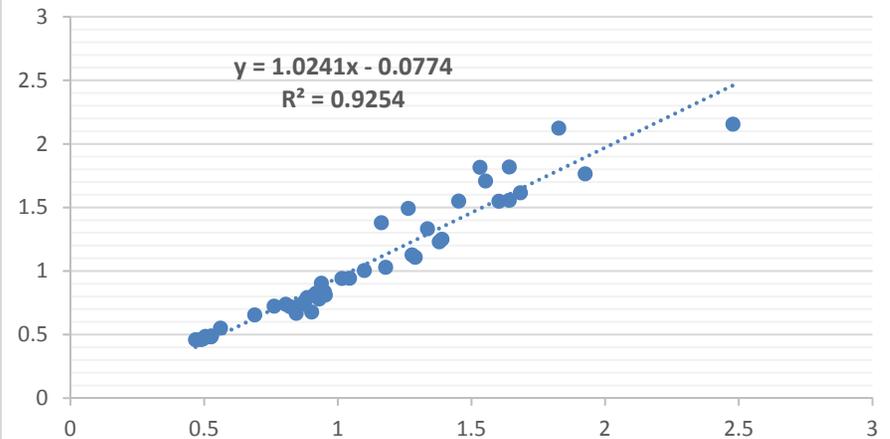

SLP MTD RIGHT vs LCMS MTD RIGHT 50 KM/H

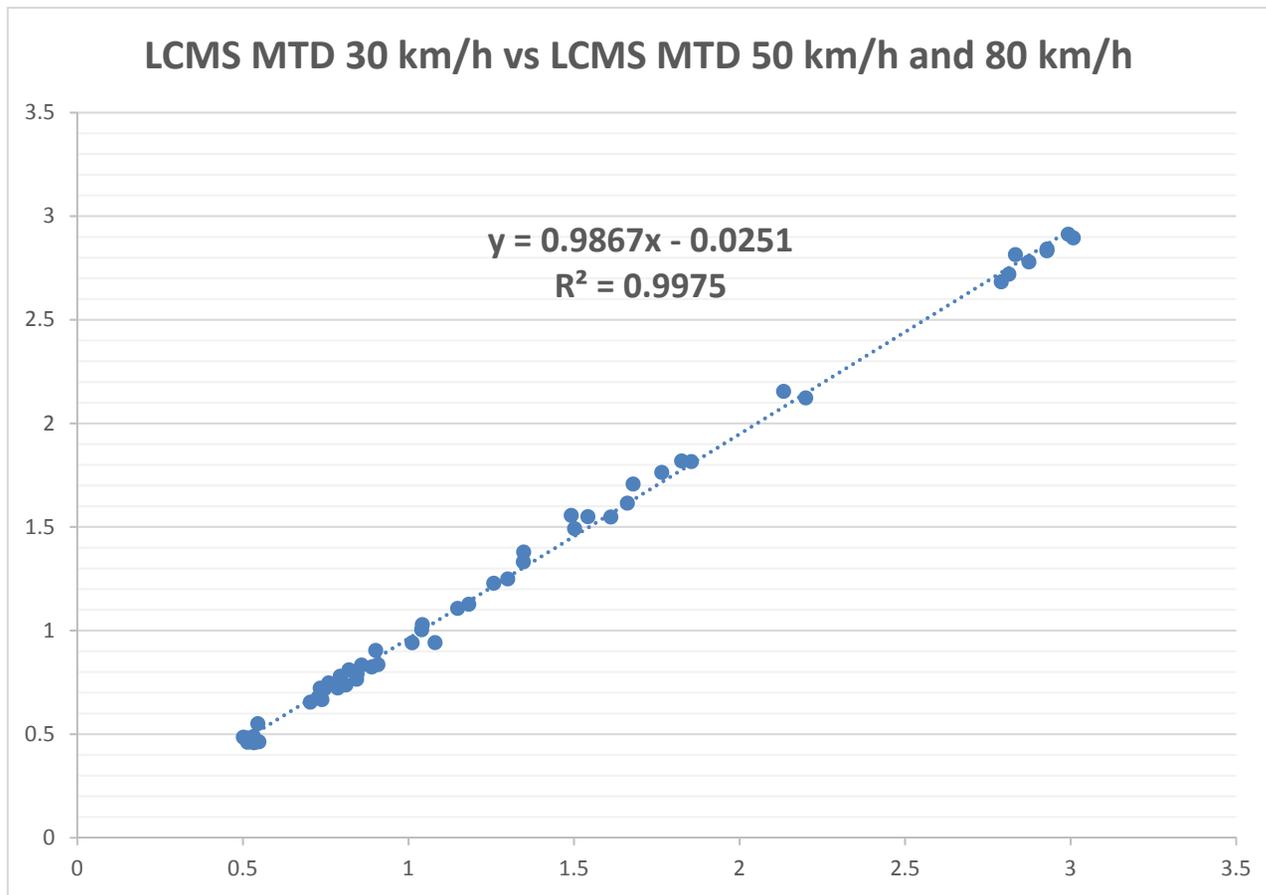

SLP MTD LEFT vs LCMS MTD 30 km/h LEFT

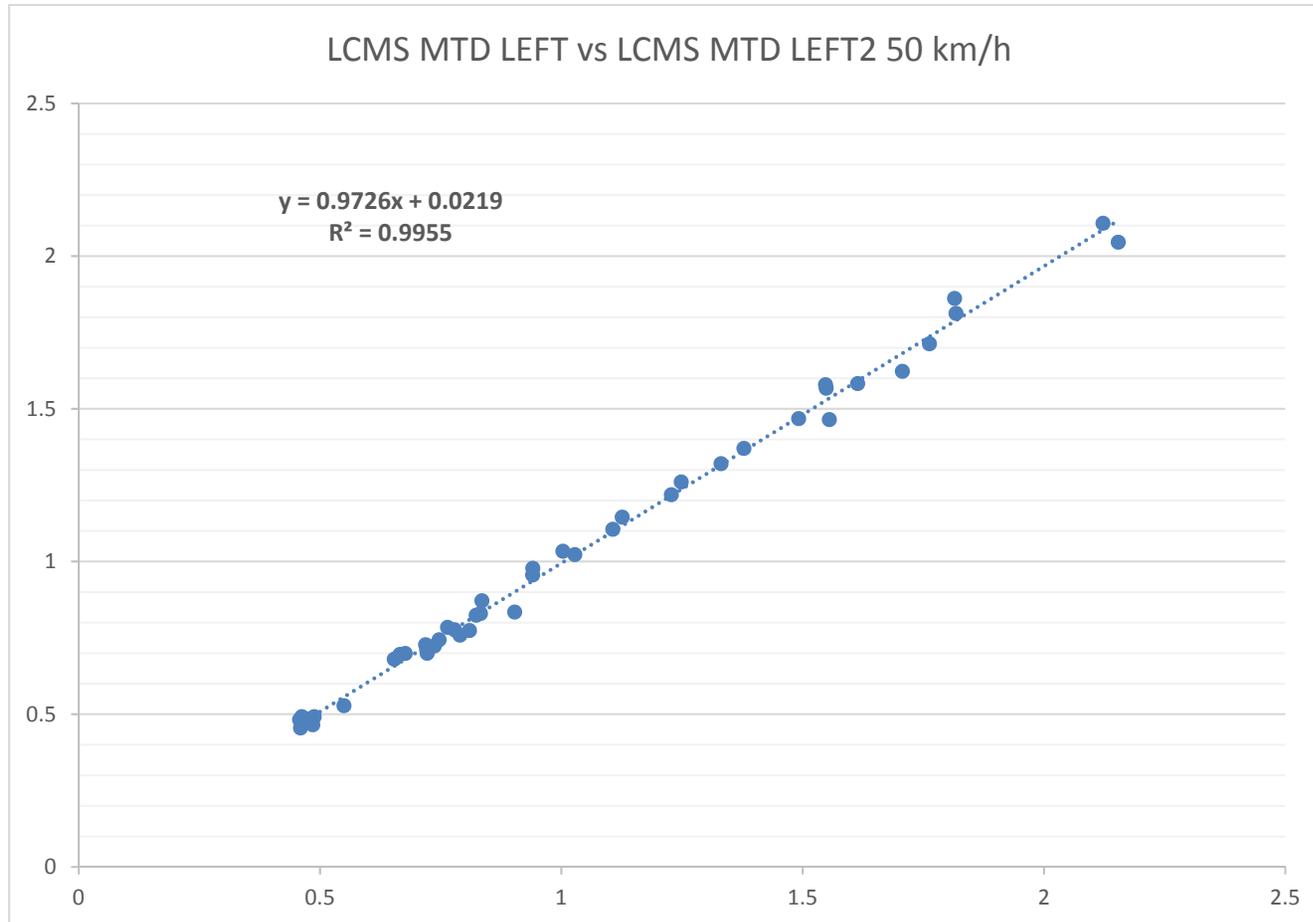

SLP MTD LEFT vs LCMS MTD LEFT 50 km/h

LCMS - Macro-texture (30km/h, 50km/h, 80km/h)

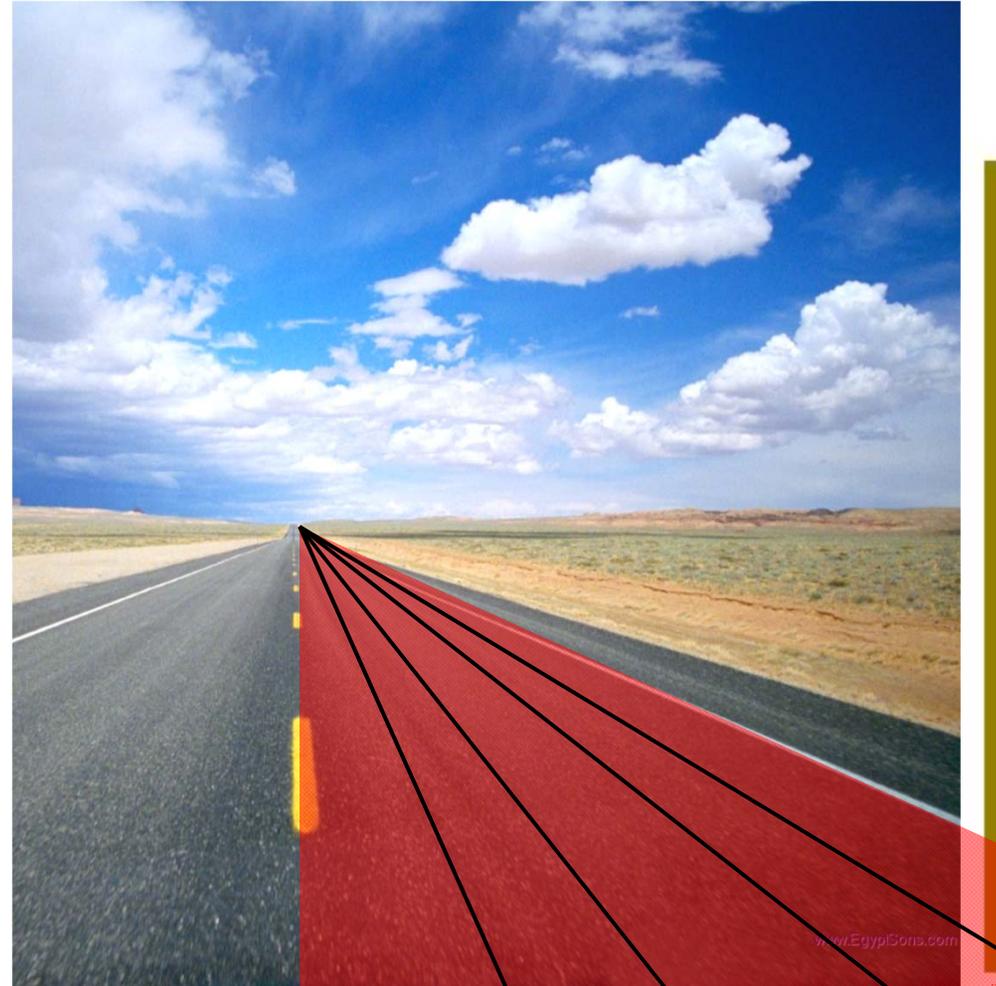

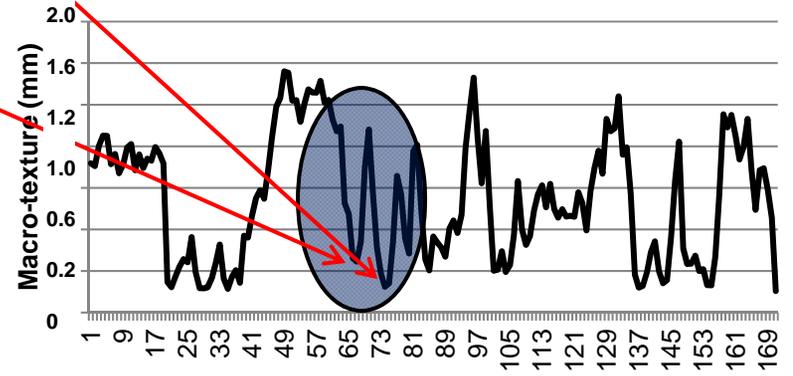

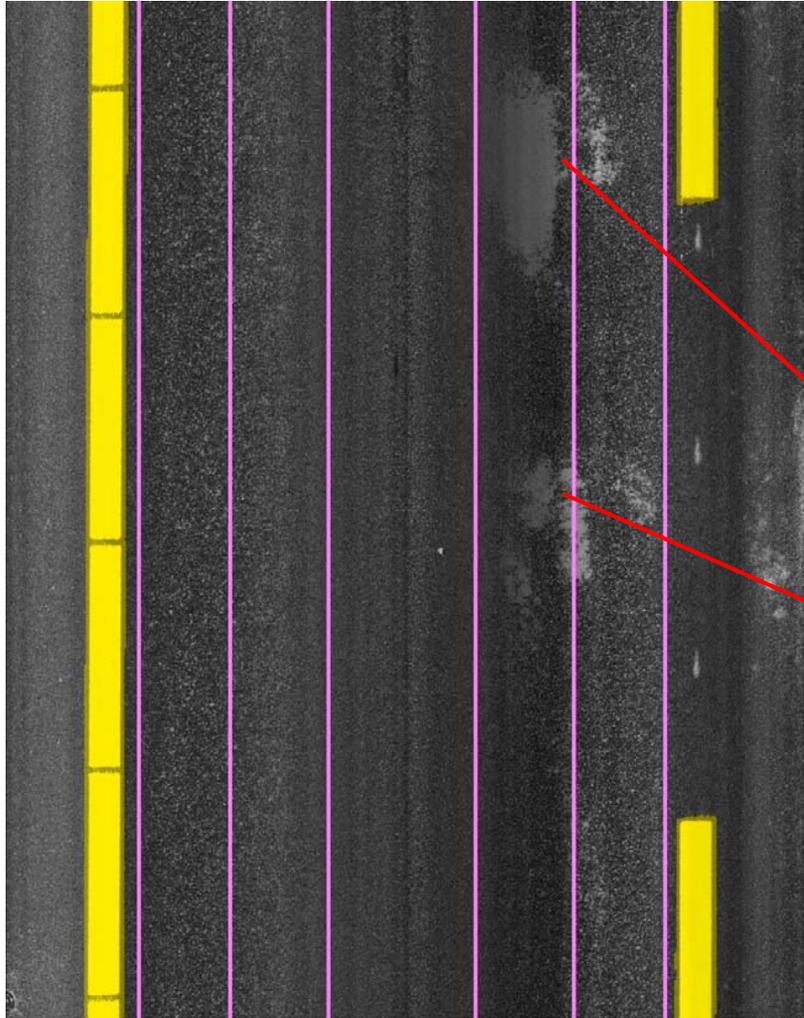

LCMS - MTD repeatability

- 7 different survey sites in New Zealand measured with SLP.
- Texture range from 0.4mm (MPD) to 3.5mm (MPD)
- Multiple runs of LCMS data were collected at different speed (30km/h, 50km/h and 80km/h).
- The LCMS high speed texture measurements correlate very well (92%) with high accuracy ground truth from SLP.
- The repeatability of LCMS texture measurements when averaged over 25m correlate very well (99+%) between different runs even at different speeds (30km/h, 50km/h, 80km/h).

- Full lane network level texture survey is possible at 100kmh
- Digital Sand Patch method (MTD)
- Macro-texture is reported:
 - 5 AASHTO bands
 - **25x25cm texture maps**
- Texture maps can be used to detect:
 - Bleeding
 - Sealed cracks
 - Raveling

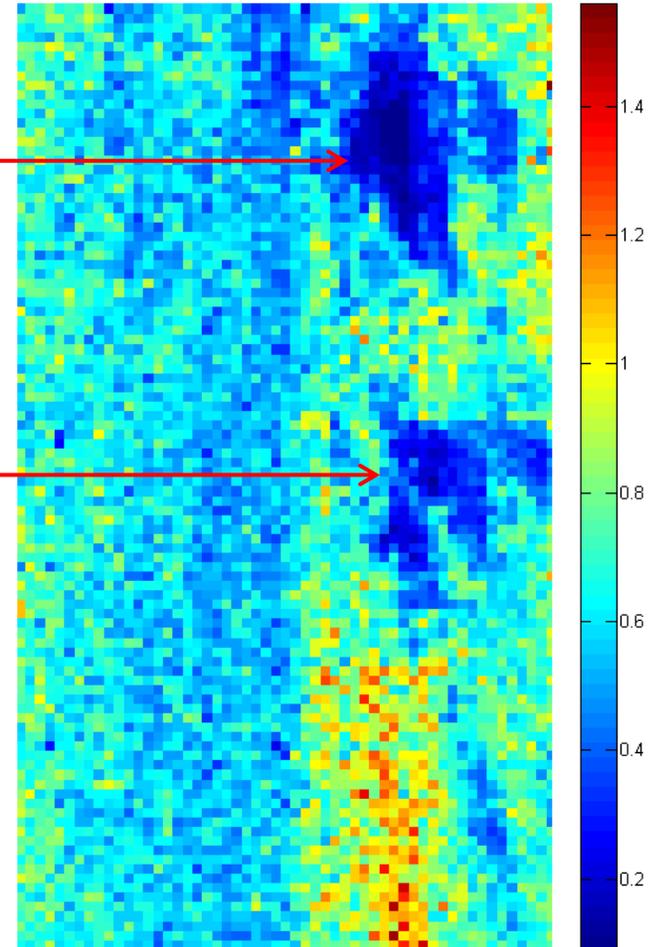

Index (each road section has 19 macro-texture values (1-19 = Section 1, 20-38=section 2, etc...))

Macrotexture: bleeding

Intensity image

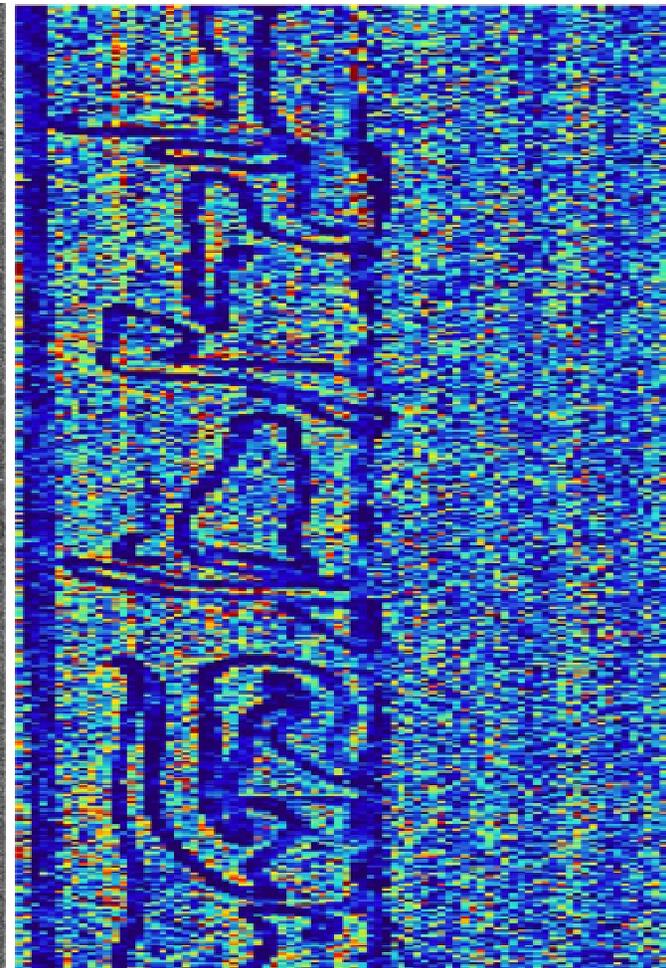

Texture image (MTD, mm)

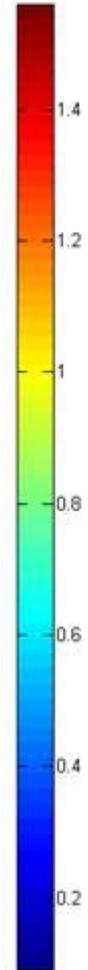

Intensity image (sealed cracks)

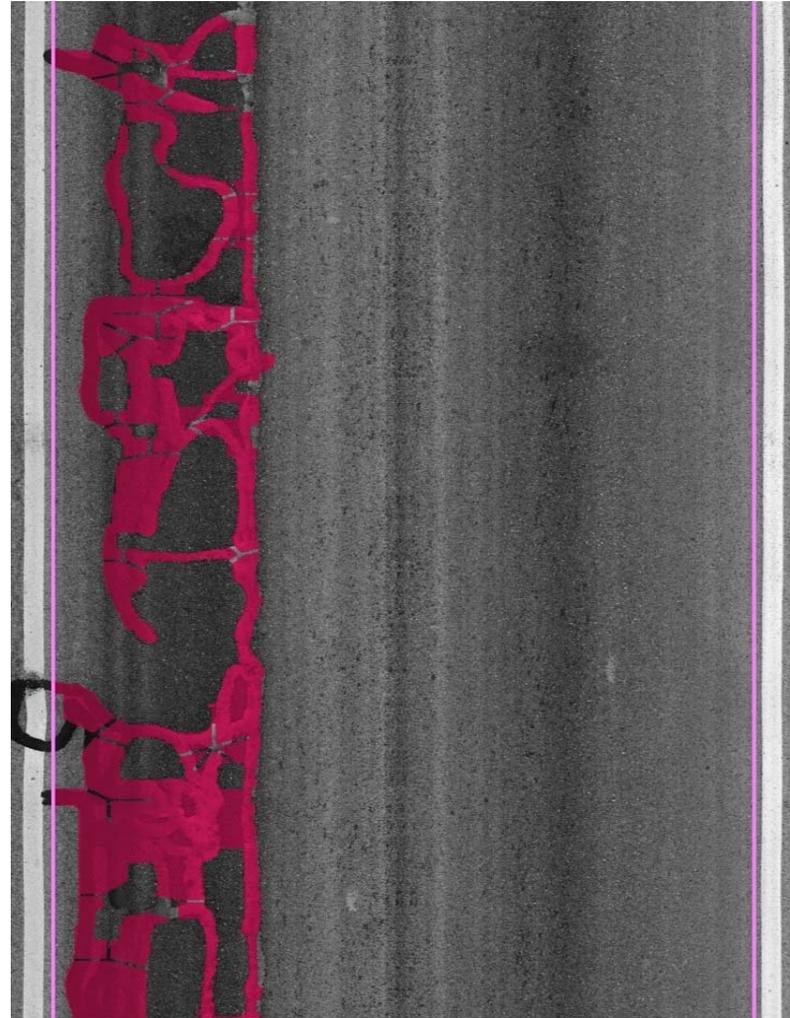

Texture image (sealed cracks)

Example (white and dark sealed cracks)

Intensity image (sealed cracks)

Detection image (sealed cracks)

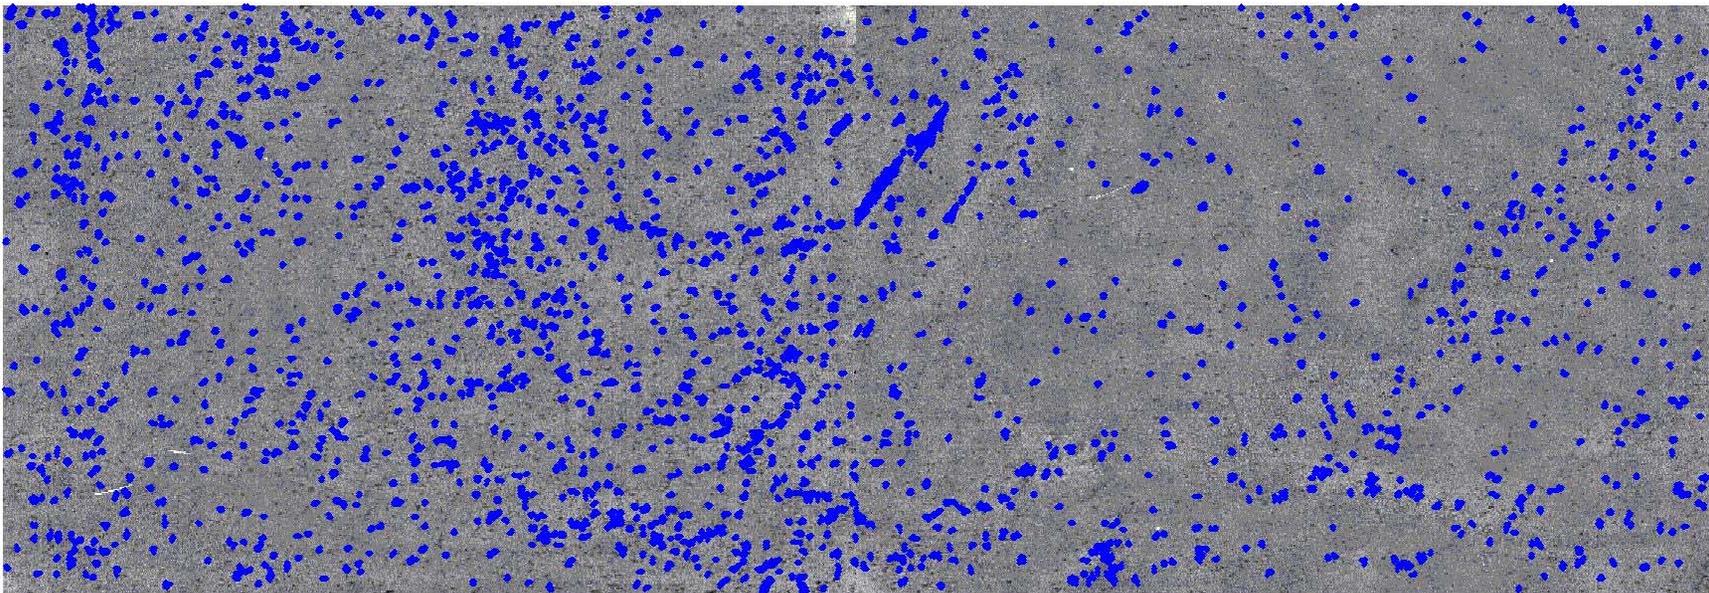

Ravelling – Loss of aggregate

Ravelling Index (RI) = The volume of aggregate loss per surface area

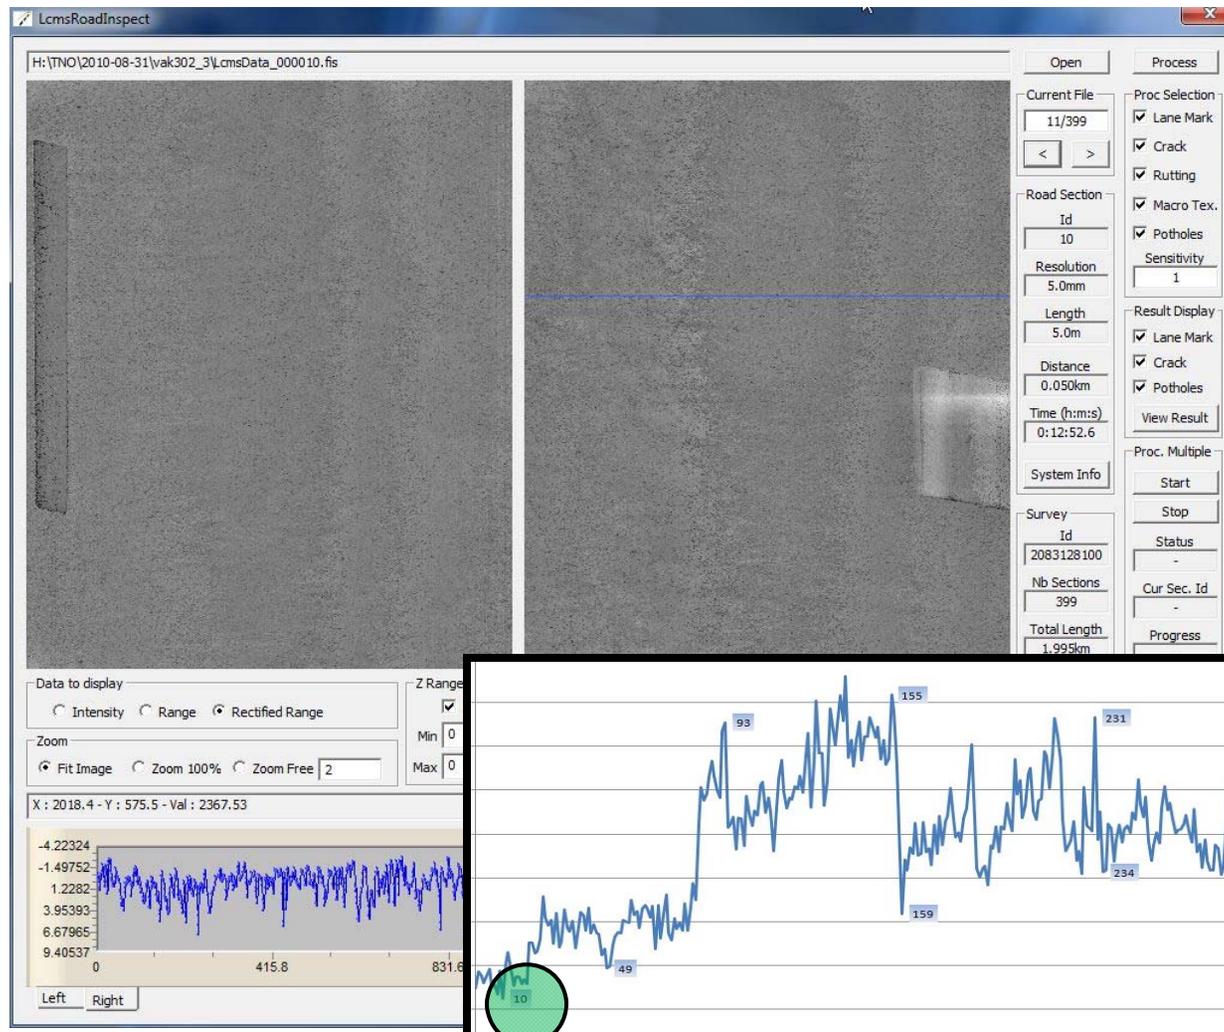

$$RI = V_{\text{aggregate loss}} / A_{\text{Total}}$$

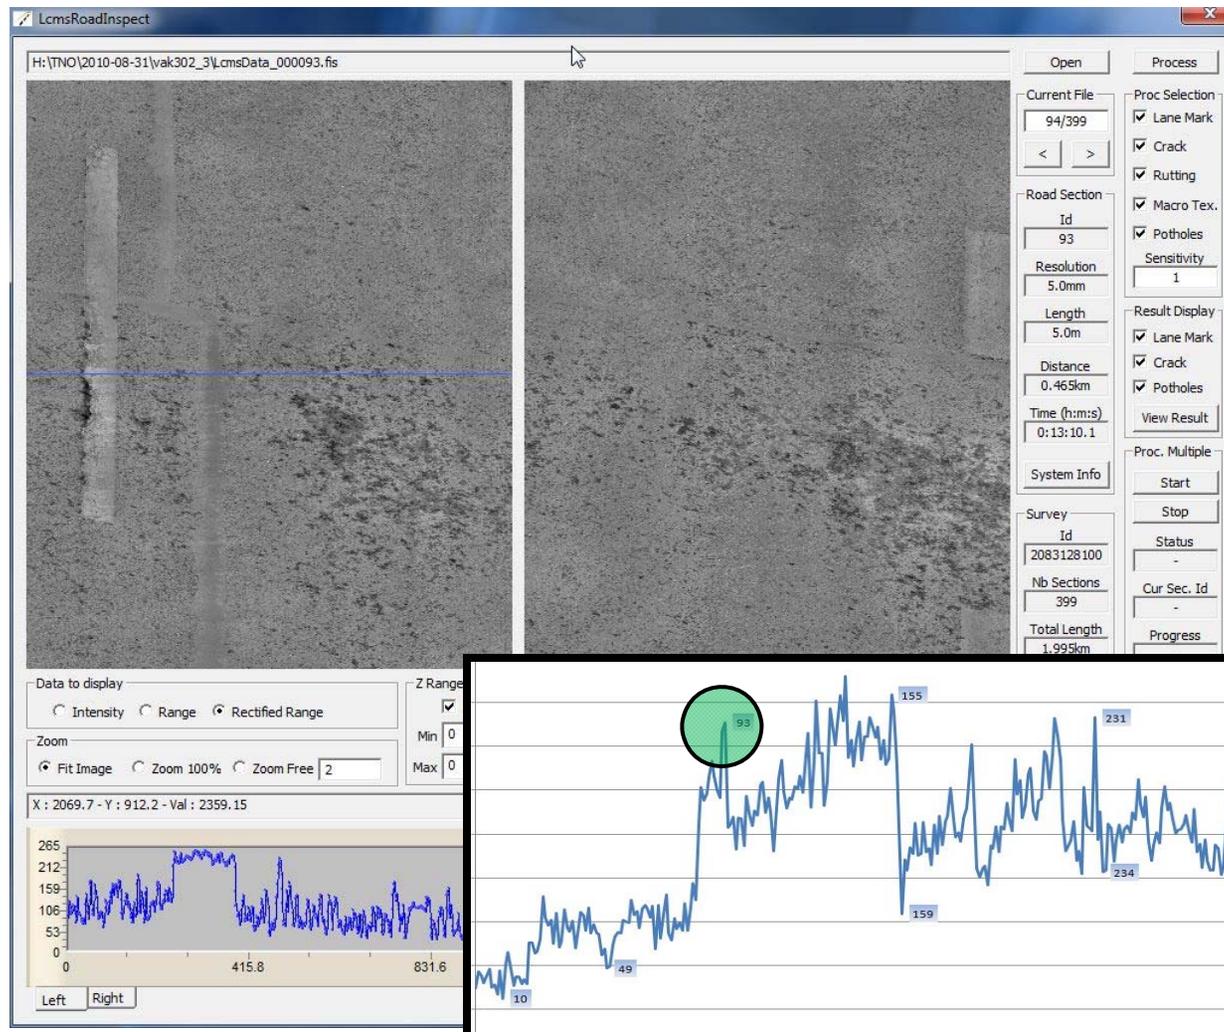

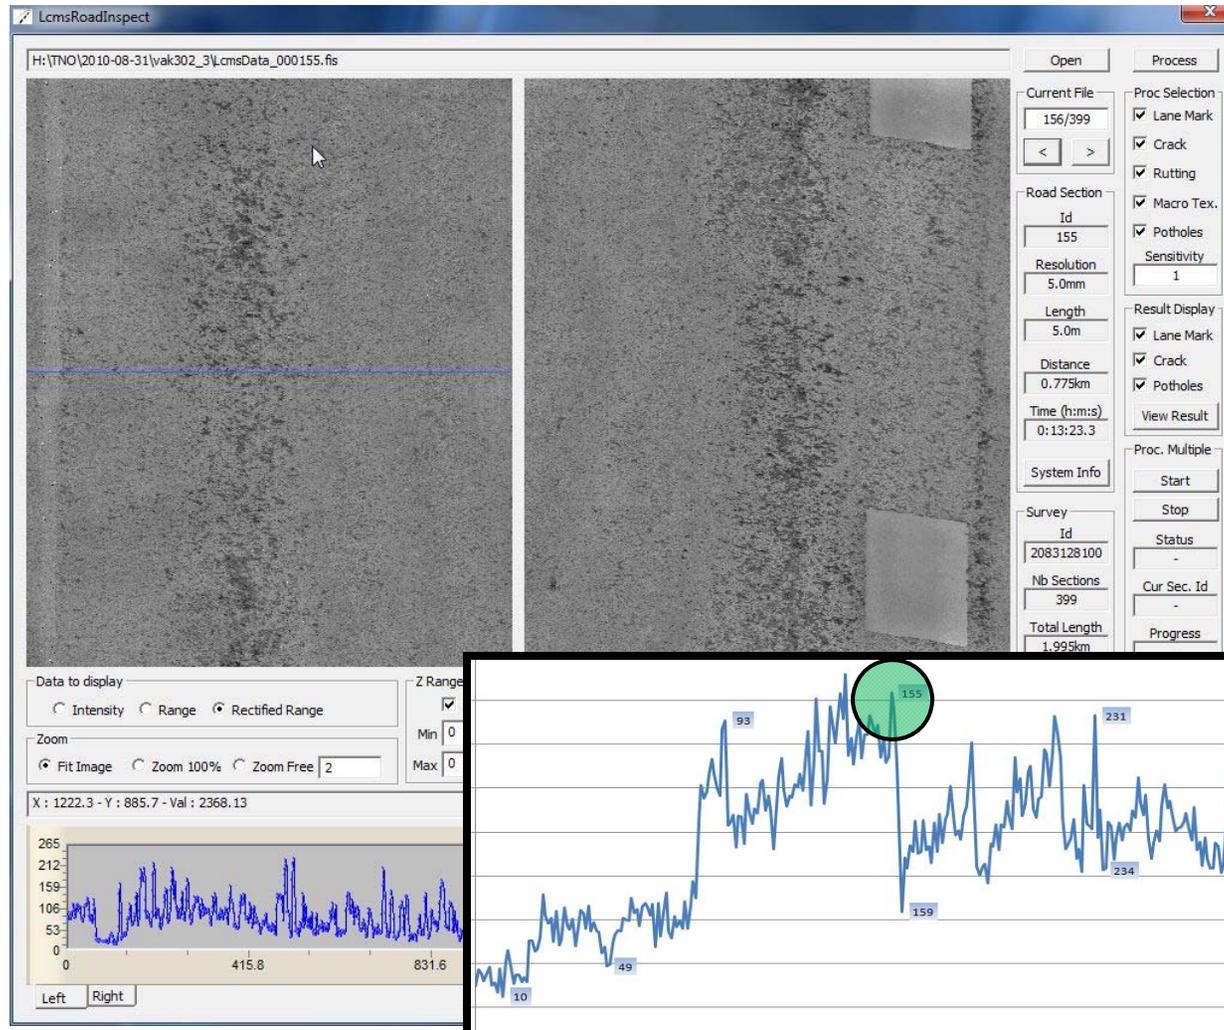

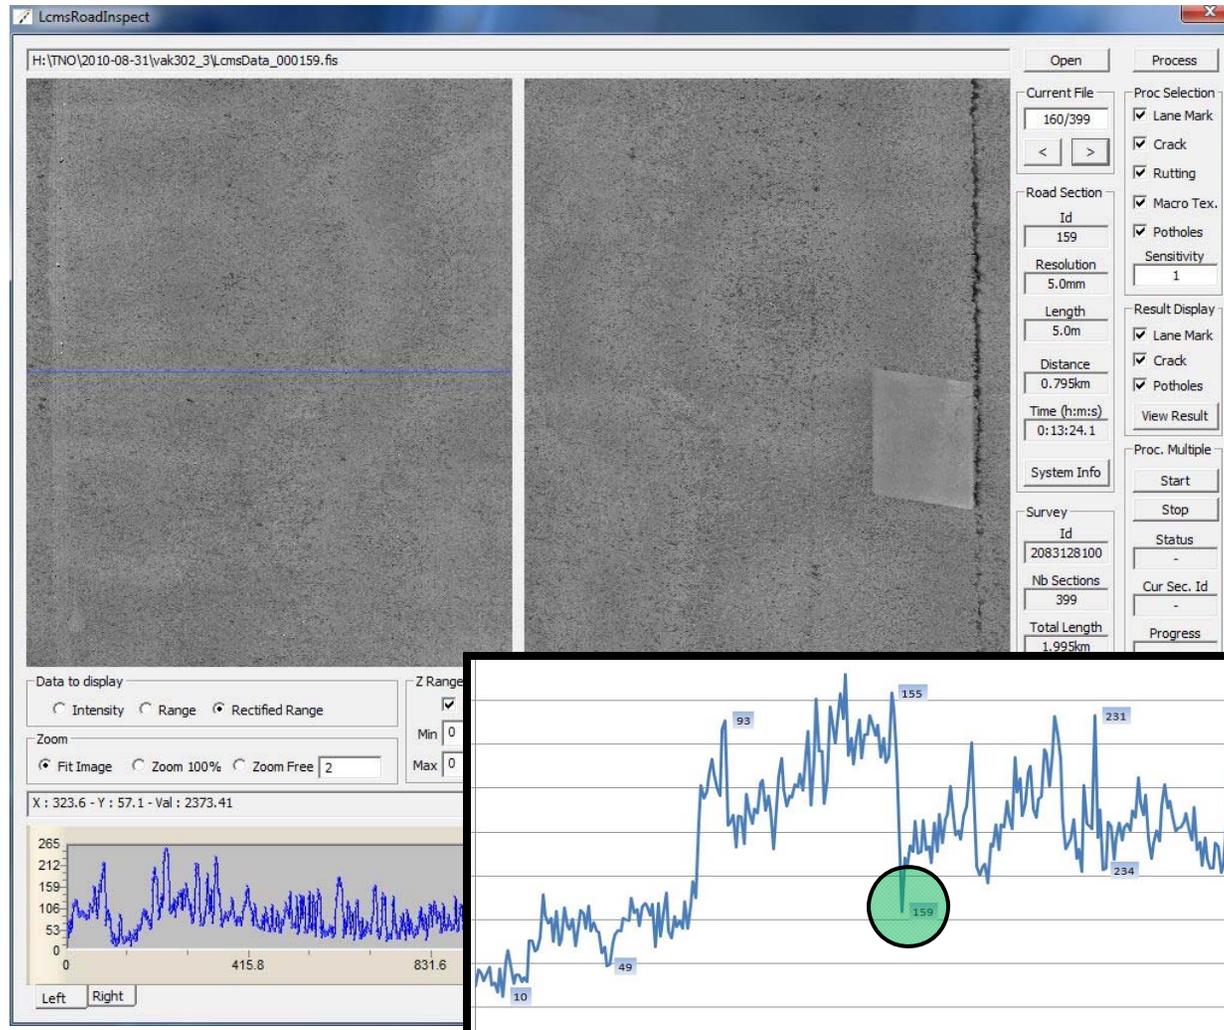

RI - Road test - Porous Asphalt in the Netherlands

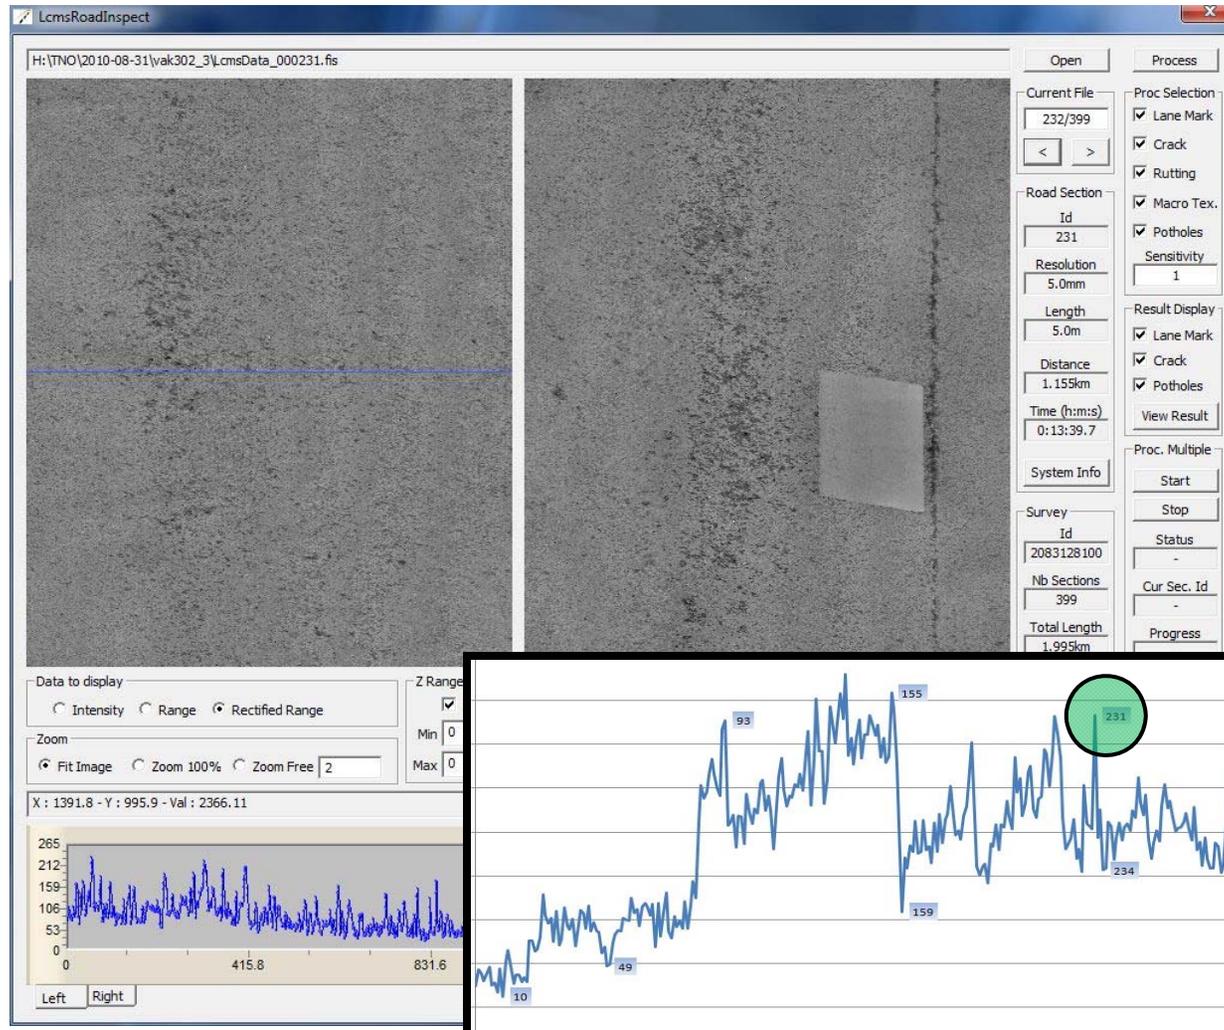

Road Section #93 : Transition between Ravelling and new pavement (Range)

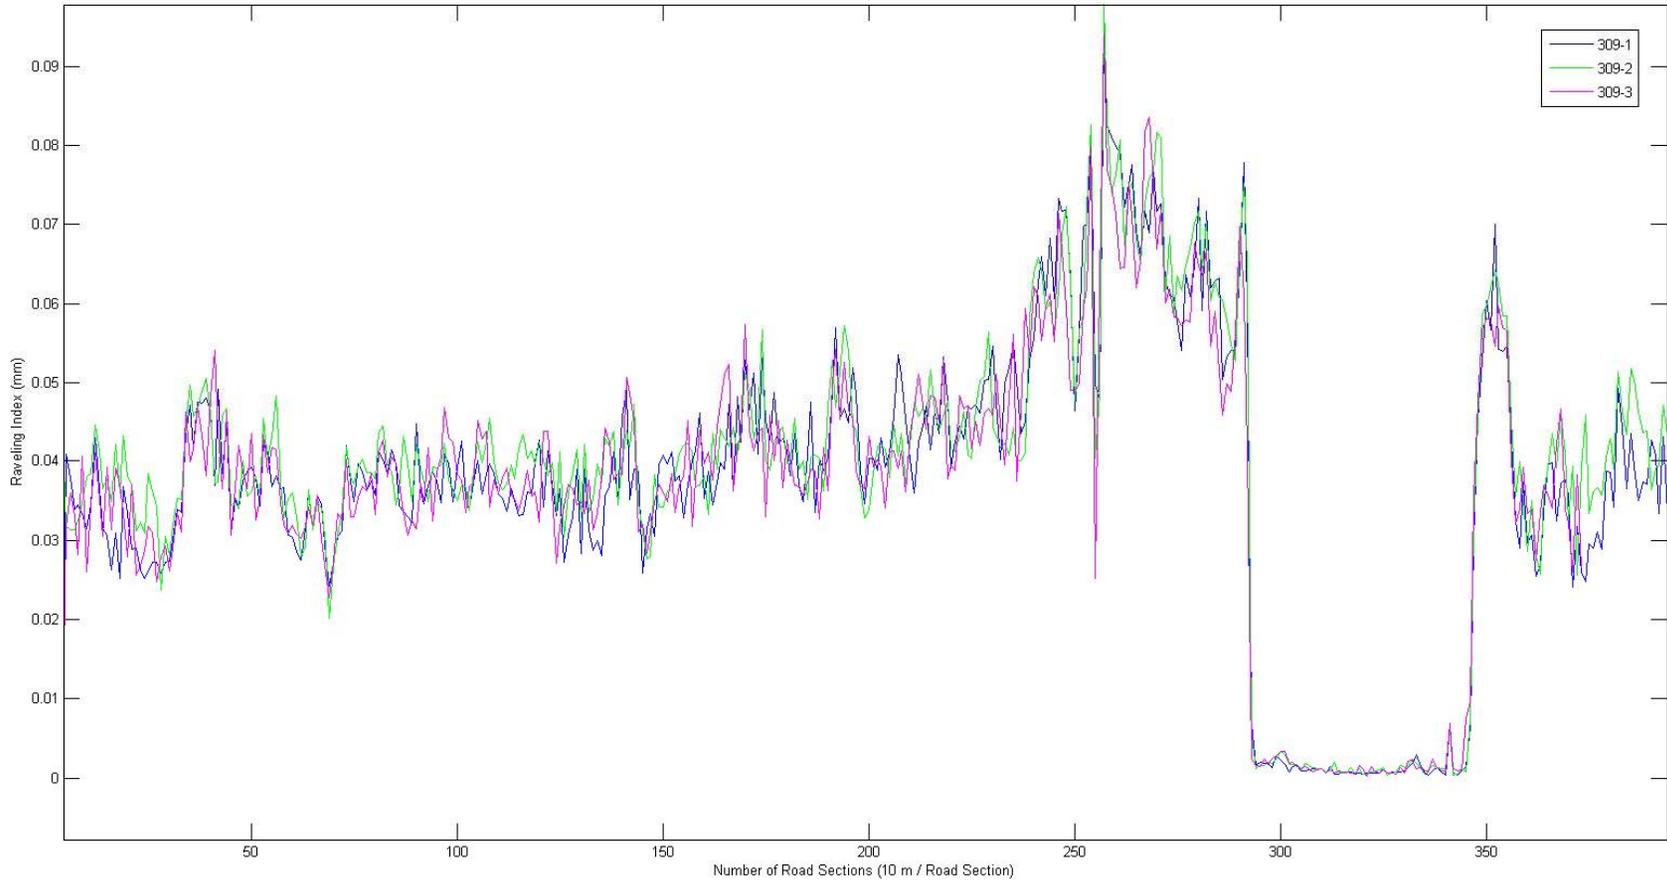

Road Section #231 : Raveling patch

Ravelling Index - Repeatability (Porous asphalt Netherlands)

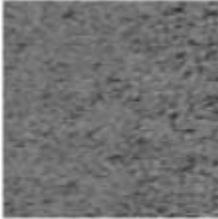

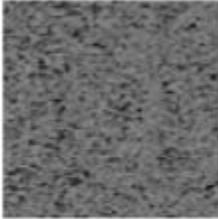

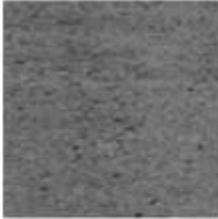

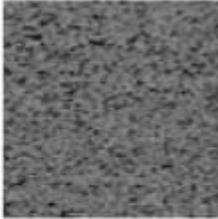

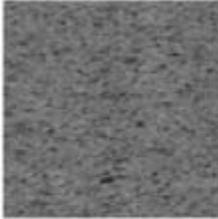

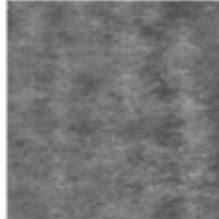

- **Highways; 5,010 km (~20,000 lane km)**
 - 10% DAC and SMA
 - **90%** Porous Asphalt
- **Raveling detection using LCMS**
 - Texture analysis is used to evaluate porous pavement type and measure aggregate loss.
 - Calibration is done by matching of severity levels with manual evaluators.

Texture analysis

- **Raveling detection using LCMS ZOAB pavements in the Netherlands**

- Calibration is done by matching of severity levels with manual evaluators.
- 93% good correlation with visual inspections!
- System operational since 2012 replacing manual surveys.
